Electronic Noise And Fluctuations In

This book looks at the physics of electronic fluctuations (noise) in solids. The author emphasizes many fundamental experiments that have become classics: physical mechanisms of fluctuations, and the nature and magnitude of noise. He also includes the most comprehensive and complete review of flicker ($1/f$) noise in the literature.

In 1925 J.B. Johnson, studying the current fluctuations of electronic emission in a thermionic tube with a simple technique, found, apart from the shot noise whose spectral density was independent of frequency and was in agreement with the Schottky formula (1.5.10) (Schottky, 1918), also a noise whose spectral density increased with decreasing frequency f (Johnson, 1925). Schottky (1926) suggested that this last noise arises from slow random changes of the thermocathode's surface, and ...

Electronic Noise and Fluctuations in Solids - NASA/ADS

Shot noise in electronic devices results from unavoidable random statistical fluctuations of the electric current when the charge carriers (such as electrons) traverse a gap. If electrons flow across a barrier, then they have discrete arrival times.

Noise (electronics) - Wikipedia

Johnson–Nyquist noise (thermal noise, Johnson noise, or Nyquist noise) is the electronic noise generated by the thermal agitation of the charge carriers (usually the electrons) inside an electrical conductor at equilibrium, which happens regardless of any applied voltage. Thermal noise is present in all electrical circuits, and in sensitive electronic equipment such as radio receivers can ...

Electronics I - Devices and Noise Helmut Spieler SLUO Lectures on Detector Techniques, December 4, 1998 LBNL 5 Consider a single noise pulse occurring in a short time interval dt at a time T prior to the measurement. The amplitude at $t = T$ is $a_n = W(T)$ If, on the average, n noise pulses occur within dt , the fluctuation of their cumulative signal level at $t = T$ is proportional to

However, photon shot noise and vacuum fluctuations entering the detector can be modeled for simplicity as annihilation (photons)-creation (electrons) operators at the surface of the detector. Since the annihilation-creation operators are incompatible operators, fluctuations at the detector surface fall out naturally.
